

Fall prevention audit & risk assessment

Equip yourself with the right information to make height safety straightforward

workplace
WINGTM

Workplace Wing's height safety risk assessment brings compliance, safety, prioritising, planning and budgeting together in one very manageable package.

Case study:

Audit of a WorkCover Site

Safe work at heights laws are complex and the regulator understands that making rooftops safe is a job for specialists. So, when WorkCover NSW needed a height safety audit of its own site it commissioned fall prevention experts, the Workplace Group of Companies.

The auditor's report provided WorkCover NSW with an overview of its compliance and risk ratings for each hazard. It also showed how WorkCover NSW could achieve compliance with a prioritised and costed list of works.

Based on the height safety audit report, WorkCover NSW engaged Workplace Wing to install:

- > Step-type ladders for access to the roof.
- > A maintenance-free sliding access hatch, so that users can always maintain three points of contact while getting on and off the roof.
- > A fully engineered static line system and anchorage points that allow contractors to safely clean the windows from an open ledge.

The site-specific costings contained in the audit report meant work fell within budget, while delivering a safe workplace for WorkCover NSW employees and contractors.

WorkCover NSW trusts the Workplace Group of Companies with its own height safety program. To find out how we can make your site safe and compliant, call 1300 734 790.

1. Height safety risk assessment

The law says Persons Conducting a Business Undertaking (PCBU) and company officers have an obligation under the Work Health and Safety Act to carry out 'due diligence' and ensure workplaces are safe.

A risk assessment based on the unique hierarchy of controls for fall prevention is the first step towards ensuring safety and minimising liability.

Complex regulations, codes and standards make it a job for specialists and your Workplace Wing report cuts through with plain English advice. OHS qualified tradespeople will consult with your staff so the risk assessment is both thorough and realistic.

2. A design for safety and compliance

With your site needs understood, Workplace Wing will design a fall prevention system to suit with an emphasis on safety, affordability, compliance and manageability.

The recommendations are comprehensively illustrated with photographs of your site so everyone can see what's needed without having to climb on the roof.

3. A prioritised and practical plan

Based on the risk assessment, your height safety report will detail a step-by-step plan towards fall prevention compliance.

A risk matrix illustrates the areas of highest priority to make planning simple.

And because our height safety experts are both trade and OHS-qualified, we deliver recommendations that are dedicated to reducing risk and yet intensely practical. They explain what needs to be done and how to do it with minimum disruption.

4. Budget costings that put you in control

Every recommendation in your risk assessment report is costed specifically for your site to assist with budgeting. It even comes with an electronic flexible reporting tool that allows you to dissect the recommendations by state, site or priority ranking.

Workplace Wing: delivering the fall prevention risk assessment that makes compliance and safety straightforward.
